

QA Test Summary Report

Manual Testing Practice Project — Chat / Social (VIP) Mobile App

Tester: Mohan Srivastav | Platform: Android | Report Date: September 19, 2026

1. Project Overview

This report summarizes a manual QA testing cycle performed on a chat-based social mobile application with VIP (in-app purchase) functionality. The app is currently available on Android only, so all testing was performed on an Android device. Testing covered authentication, session management, security, real-time messaging performance, media handling, profile management, UI/UX, permissions, network resilience, monetization, and account settings.

Objective: Validate core functional correctness and identify defects affecting security, performance, stability, and usability before release.

Test Environment: Android 14, tested over Wi-Fi and Mobile Data (4G).

2. Scope & Methodology

Testing type: Manual, black-box functional and non-functional (UI/UX, performance, security, resilience) testing on a mobile client.

Approach:

- Test scenarios were derived from core app modules (Authentication, Security, Chat, Media, Performance, Network, Monetization, Settings).
- Each scenario was broken down into individual test cases with defined steps and expected results.
- Each test case was executed manually and the actual result logged against the expected result.
- Failures were logged as defects with an assigned severity (Critical / High / Medium).

3. Execution Summary

Metric	Value
Total Test Cases Executed	30
Passed	12
Failed	18
Pass Rate	40.0%
Critical-Severity Defects	6
High-Severity Defects	6
Medium-Severity Defects	6

Of 30 test cases executed, 12 passed (40.0%) and 18 failed. Failures span session handling, real-time performance, network resilience, and monetization — the areas needing priority attention before release.

4. Scenario-wise Results

Scenario ID	Scenario	Total	Passed	Failed	Status
SC-01	Account Registration & Login	3	3	0	PASS
SC-02	Session & Device Security	5	1	4	PARTIAL
SC-03	Credential Input Security	1	1	0	PASS
SC-04	Notifications & Email Communication	2	1	1	PARTIAL
SC-05	Real-Time Messaging Performance	4	0	4	FAIL
SC-06	Media Upload	1	0	1	FAIL
SC-07	Profile Management	2	2	0	PASS
SC-08	Chat UI/UX Behaviour	4	0	4	FAIL
SC-09	Theme & Layout	1	1	0	PASS
SC-10	Runtime Permissions	1	1	0	PASS
SC-11	Network Resilience	2	0	2	FAIL
SC-12	VIP Monetization	1	0	1	FAIL
SC-13	Room Capacity	1	1	0	PASS
SC-14	Account Settings	1	1	0	PASS
SC-15	Screen Orientation Handling	1	0	1	FAIL

5. Key Findings

Critical Issues

- No brute-force / rate-limiting protection on login — accounts are vulnerable to unlimited password-guessing attempts.
- Sessions are terminated unexpectedly on app backgrounding and on brief network interruptions, forcing users to log in repeatedly.
- The UI freezes (ANR-like state) on weak network connections instead of showing a loading indicator.
- VIP purchase fails with a Google Play Billing verification error, blocking monetization.

High-Priority Issues

- OTP/confirmation emails are delayed by roughly 30 minutes, well beyond acceptable UX limits.
- Chat rooms and private messages show noticeable delivery lag, and read-receipt (double-tick) status does not sync reliably.
- The message input bar does not anchor above the keyboard, floating mid-screen instead.

- New-device logins do not trigger a security alert notification.

Medium-Priority Issues

- Image uploads are intermittently rejected.
- Chat history force-scrolls to the latest message instead of preserving the user's scroll position.
- Emoji selection is mismatched, with unrelated emojis rendering as a duck.
- Send and Delete controls are placed too close together, creating a mis-tap risk.
- No 'offline' banner is shown when connectivity is lost.
- The app has no screen rotation support — layout stays locked in Portrait mode even with OS Auto-Rotate enabled and the device turned to Landscape.

6. Recommendations

- Prioritize fixing session-stability issues (backgrounding, brief network drops) and the login rate-limiting gap — both affect security and basic usability.
- Investigate the VIP purchase verification failure with the Google Play Billing integration before any monetization push.
- Address UI freezing on weak networks by adding proper async loading states.
- Fix the email delivery pipeline to bring OTP/confirmation latency down to under a couple of minutes.
- Re-test all Critical and High severity items after fixes, followed by a full regression pass.

7. Conclusion

This cycle executed 30 test cases across 15 scenarios, with a 40.0% pass rate. Core authentication and profile flows are stable, but session management, real-time performance, network resilience, UI orientation, and monetization require fixes before the app is release-ready. Detailed step-by-step test cases, the execution record, the result log, and the formal defect entries are provided in the accompanying Test Cases, Test Execution Record, Test Result Log, and Defect Report documents.
